

Inverse Variation

In Investigation 1, you explored the relationship of strength, number of layers, and length of a bridge. You found that the relationship between strength and number of layers was approximately linear. You also found that the relationship between strength and length was not linear. In this investigation, you will explore other nonlinear functions.

3.1 Rectangles With Fixed Area

In recent years, the populations of many small towns have declined as residents move to large cities for jobs. The town of Roseville has a plan to attract new residents.

Roseville offers free land to “homesteaders” who are willing to build houses. Each lot is rectangular and has an area of 21,780 square feet. The lengths and widths of the lots vary.

The town planners want a quick way to check lot sizes for the new homesteaders.

Common Core State Standards

8.F.A.3 Interpret the equation $y = mx + b$ as defining a linear function whose graph is a straight line; give examples of functions that are not linear.

Also **8.F.A.1, 8.F.B.5, 8.SPA.1, A-CED.A.2, A-CED.A.4, F-IF.C.8, F-BFA.1a, S-ID.B.6a**

- What function relates the length and width of rectangles with area 21,780 square feet?
- What patterns appear in tables and graphs of that function?

Problem 3.1

In Problem 3.1, you will look at patterns in length and width values for rectangles with fixed area.

- A** 1. Copy and complete this table.

Rectangles With Area 24 in.²

Length (in.)	1	2	3	4	5	6	7	8
Width (in.)	■	■	■	■	■	■	■	■

2. Plot your (length, width) data from part (1) on a graph like the one below. Then draw a line or curve that models the pattern in the data.

Rectangles With Area 24 in.²

3. Describe the pattern of change in the width of a rectangle as the length increases. Is the relationship between length and width linear?
4. Write an equation relating width w to length l for rectangles with an area of 24 square inches.

continued on the next page >

Problem 3.1 *continued*

- B** Now consider rectangles with area of 32 square inches.
- Write an equation for the relationship between the width w and the length ℓ .
 - Make a table and a graph of values for w and ℓ . Show lengths from 1 to 10 inches.
- C** Compare tables, graphs, and rules for the functions relating width and length of rectangles with area 24 square inches and area 32 square inches. Then use your results to answer the Roseville planners' questions about lots with area 21,780 square feet.

A C E Homework starts on page 69.

3.2 Distance, Speed, and Time

The relationship between length and width for rectangles with a fixed area is not linear. As ℓ increases, w decreases, but not at a constant rate. The graph is a curve showing how ℓ and w relate to each other.

The relationship between ℓ and w is an example of an important relationship called an **inverse variation**. Two nonzero variables x and y are related by an **inverse variation** if

$$y = \frac{k}{x} \quad \text{or} \quad xy = k$$

where k is a constant other than 0.

Here are some questions about inverse variation that you can keep in mind as you work on the following problems about distance, speed, and time of travel.

- ?**
- How does the value of one variable change as the value of the other changes?
 - How is that pattern of change shown in a table of data and on a graph?
 - What equation shows how the two variables are related?

Problem 3.2

Inverse variation occurs in many situations. You have probably thought about how the length of a trip depends on speed.

- A** Mr. Cordova lives in Detroit, Michigan. He often travels to Baltimore, Maryland, to visit his grandfather. The trip is about 500 miles each way. Here are Mr. Cordova's notes for his trips to Baltimore last year.

Date	Notes	Travel Time
February 15	Traveled by plane.	1.5 hours
May 22	Drove.	10 hours
July 3	Drove. Stopped for repairs.	14 hours
November 23	Flew. Flight delayed.	4 hours
December 23	Took overnight train.	18 hours

- Calculate the average speed in miles per hour for each trip. Record your results in a table like this.

Mr. Cordova's Baltimore Trips

Travel Time (h)	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Average Speed (mi/h)	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

- Plot the data on a graph. Draw a line or curve to model the data. Describe the change in average speed as travel time increases.
- Write an equation for the relationship between time t and speed s .
- Is the relationship between distance and time an inverse variation? Explain why or why not.

continued on the next page >

Problem 3.2 *continued*

- B** The Cordova family is planning a trip of 300 miles to Mackinac Island, near the upper peninsula of Michigan. Mr. Cordova does some calculations to see how the travel time will change if the family drives at different average speeds.

Travel Times for Different Speeds

Average Speed (mi/h)	30	40	50	60	70
Travel Time (h)	10	7.5	6	5	4.3

- Describe the change in travel time as the average speed increases.
 - What equation relates travel time t to average speed s ?
 - How is the pattern relating travel time to average speed shown in a graph of (s, t) data?
 - Is the relationship between travel time and average speed an inverse variation? Explain why or why not.
- C** Suppose Mr. Cordova decides to aim for an average speed of 50 miles per hour for the trip to Mackinac Island.
- Make a table and a graph to show how the distance traveled will increase as time passes. Show times from when the family leaves home to when they reach their destination.
 - Describe the pattern of change in distance as time passes. Explain how that pattern is shown by values in your table and points on your graph.
 - Write an equation relating distance traveled d to time t .
 - Is the equation relating distance and time an inverse variation? Explain why or why not.

3.3 Planning a Field Trip

Finding Individual Cost

The science teachers at Everett Middle School want to take their eighth-graders on a field trip to a nature center. It costs \$750 to rent the center facilities.

The school budget does not provide funds to rent the nature center, so students must pay a fee. The trip will cost \$3 per student if all 250 go. The teachers know, however, that it is unlikely that all students will go. They want a way to find the cost per student for any number of students.

- What kind of relationship between number of students and cost should the teachers expect?
- How can that relationship be expressed with an equation and a graph?

Problem 3.3

To identify the relationship between the number of students and the cost, begin with sample calculations. Then look for a pattern in your results.

- A** 1. Copy and complete the table below.

Number of Students	25	50	75	100	125	150	175	200	250
Cost per Student (dollars)	■	■	■	■	■	■	■	■	■

2. Describe the pattern relating the cost per student to the number of students who visit the nature center.
3. Write an equation relating cost per student c to number of students n .
4. Sketch a graph showing how the cost per student changes as the number of students increases.

continued on the next page >

Problem 3.3 *continued*

- B**
- Find the change in the cost per student as the number of students increases in the following ways.
 - from 10 to 20
 - from 100 to 110
 - from 200 to 210
 - Is the function relating number of students and cost linear? Explain.
 - Do equal increases in numbers of students cause equal decreases in cost per student? Explain.
- C**
- How will doubling the number of students change the cost per student? To test your ideas about that question, find answers to these related questions.
- Find the change in per-student cost as the number of students increases in the following ways.
 - from 20 to 40
 - from 40 to 80
 - from 80 to 160
 - Describe any patterns you see in your answers to part (1).
 - How does your equation from Question A help to explain the effect of doubling the number of students?
- D**
- The science teachers decide to charge \$5 per student for the field trip. They will use any extra money to buy science equipment for the school.

- Write an equation for the amount A the teachers will collect if n students go on the trip.
- Sketch a graph of the relationship.
- Does the graph show a linear relationship or an inverse variation? Explain.

3.4 Modeling Data Patterns

In many real-world problems it is impossible to find an equation that fits given data exactly. For example, consider the table and graph below. They show the bridge experiment data collected by a group of students.

Bridge Experiment Data

Length (in.)	Breaking Weight (pennies)
4	41
6	26
8	19
9	17
10	15

Bridge Experiment Data

- Do the data suggest the relationship between length and breaking weight is linear or an inverse variation?
- What equation would model the relationship well?

Problem 3.4

Use the data from the table and the graph.

- What do you see in the table and the graph that suggests an inverse variation relationship between breaking weight w and bridge length ℓ ?
- What value of k would make the equation $k = w\ell$ true for a length of 4 inches? For a length of 6 inches?
- What equation is a good model for the function relating weight w to length ℓ ?
- What breaking weights does your model predict for bridges of length 3, 5, 7, and 11 inches?

A C E Homework starts on page 69.
